A Data Communication Protocol for Building Automation and Control Networks
SPECIAL NOTE

This American National Standard (ANS) is a national voluntary consensus Standard developed under the auspices of ASHRAE. Consensus is defined by the American National Standards Institute (ANSI), of which ASHRAE is a member and which has approved this Standard as an ANS, as "substantial agreement reached by directly and materially affected interest categories. This signifies the concurrence of more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that an effort be made toward their resolution." Compliance with this Standard is voluntary until and unless a legal jurisdiction makes compliance mandatory through legislation.

ASHRAE obtains consensus through participation of its national and international members, associated societies, and public review. ASHRAE Standards are prepared by a Project Committee appointed specifically for the purpose of writing the Standard. The Project Committee Chair and Vice-Chair must be members of ASHRAE; while other committee members may or may not be ASHRAE members, all must be technically qualified in the subject area of the Standard. Every effort is made to balance the concerned interests on all Project Committees.

The Senior Manager of Standards of ASHRAE should be contacted for
a. interpretation of the contents of this Standard,
b. participation in the next review of the Standard,
c. offering constructive criticism for improving the Standard, or
d. permission to reprint portions of the Standard.

DISCLAIMER

ASHRAE uses its best efforts to promulgate Standards and Guidelines for the benefit of the public in light of available information and accepted industry practices. However, ASHRAE does not guarantee, certify, or assure the safety or performance of any products, components, or systems tested, installed, or operated in accordance with ASHRAE’s Standards or Guidelines or that any tests conducted under its Standards or Guidelines will be nonhazardous or free from risk.

ASHRAE INDUSTRIAL ADVERTISING POLICY ON STANDARDS

ASHRAE Standards and Guidelines are established to assist industry and the public by offering a uniform method of testing for rating purposes, by suggesting safe practices in designing and installing equipment, by providing proper definitions of this equipment, and by providing other information that may serve to guide the industry. The creation of ASHRAE Standards and Guidelines is determined by the need for them, and conformance to them is completely voluntary.

In referring to this Standard or Guideline and in marking of equipment and in advertising, no claim shall be made, either stated or implied, that the product has been approved by ASHRAE.
[This foreword and the “rationales” on the following pages are not part of this standard. They are merely informative and do not contain requirements necessary for conformance to the standard.]

FOREWORD

The purpose of this addendum is to present a proposed change for public review. These modifications are the result of change proposals made pursuant to the ASHRAE continuous maintenance procedures and of deliberations within Standing Standard Project Committee 135. The proposed changes are summarized below.

135-2016bu-1. Introduce BACnetARRAY of BACnetLIST collection property data type, p. 3
135-2016bu-2. Clarifications on character and value encoding issues, p. 14
135-2016bu-3. Clarify transmission of unconfirmed COV notifications, p. 19
135-2016bu-4. Clarify logging of event notifications, p. 20
135-2016bu-5. Clarify recording of status events in log buffers, p. 21
135-2016bu-6. Clarify Event Enrollment object reliability evaluation, p. 22
135-2016bu-7. Clarify the Global Group object reliability evaluation, p. 23

In the following document, language to be added to existing clauses of ANSI/ASHRAE 135-2016 and Addenda is indicated through the use of italics, while deletions are indicated by strikethrough. Where entirely new subclauses are proposed to be added, plain type is used throughout. Only this new and deleted text is open to comment at this time. All other material in this document is provided for context only and is not open for public review comment except as it relates to the proposed changes.

The use of placeholders like X, Y, Z, X1, X2, N, NN, x, n, ?, etc., should not be interpreted as literal values of the final published version. These placeholders will be assigned actual numbers/letters only after final publication approval of the addendum.
135-2016bu-1. Introduce BACnetARRAY of BACnetLIST collection property data type

Rationale

The definition of BACnetLIST does not cover the case when a list is an element of a BACnetARRAY. In addition, the AddListElement, RemoveListElement, and ReadRange services are using the term "list", where it remains unclear what this exactly is.

A new collection property type BACnetARRAY of BACnetLIST of <datatype> is introduced, which is specified to be the required and only datatype being applicable for the array index in the AddListElement, RemoveListElement, and ReadRange services. Currently, there are no standard properties that are a BACnetARRAY of BACnetLIST.

In addition, the AddListElement, RemoveListElement, and ReadRange services language in Clause 15 is made consistent with these definitions.

[Change Clause 12.1.5, p. 154]

12.1.5 Array and List Properties

Some of the properties of certain BACnet objects need to represent a collection of data elements of the same type, rather than a single primitive data value or a complex datatype constructed from other datatypes. In some instances, the size of this collection of data elements is fixed, while in other instances the number of elements may be variable. In some cases the elements may need to be accessed individually or their order may be important. BACnet provides two three forms of datatypes for properties that represent a collection of data elements of the same type: "BACnetARRAY" and "BACnetLIST", "BACnetARRAY of BACnetLIST".

[Insert new Clause 12.1.5.X, p. 154]

12.1.5.X Array of List Properties

A "BACnetARRAY of BACnetLIST" datatype is a structured datatype consisting of a BACnetARRAY, where all array elements are a sequence of data elements having the same datatype. When accessing a property of this datatype, then accessing an array element shall access the entire sequence of the array element. Only the AddListElement, RemoveListElement, and ReadRange services allow access to individual list elements within an array element of a property of this datatype. Array elements of this datatype shall behave as a BACnetLIST. Properties of this datatype require special encoding. See Clause 20.2.X.

[Change Clause 15.1, p. 679]

15.1 AddListElement Service

The AddListElement service is used by a client BACnet-user to add one or more list elements to an object property that is a list BACnetLIST or is a BACnetARRAY of BACnetLIST.

[Change Clause 15.1.1.1.1, p. 679]

15.1.1.1.1 Object Identifier

This parameter, of type BACnetObjectIdentifier, shall provide the means of identifying the object whose specified list property is to be modified by this service.
15.1.1.3 Property Array Index

If the property identified above is of datatype array BACnetARRAY of BACnetLIST, this conditional parameter of type Unsigned shall be present and shall indicate the array index of the array element of the referenced property to be modified by this service. Otherwise, it shall be omitted. The index value, if this parameter is present, shall not be zero.

15.1.1.4 List of Elements

This parameter specifies one or more elements that shall be added to the property specified by the 'Property Identifier' parameter, or to the array element of the property if the 'Property Array Index' parameter is present. The datatype of the elements of this parameter is determined by the definition of the object type for the object specified by the 'Object Identifier' parameter.

15.1.1.2 Result(+)

The 'Result(+)' parameter shall indicate that the service request succeeded and all of the specified elements were added to the list BACnetLIST.

15.1.1.3 Result(-)

The 'Result(-)' parameter shall indicate that the service request failed and none of the specified elements were added to the list BACnetLIST. The reason for failure is specified by the 'Error Type' parameter.

15.1.1.3.1 Error Type

This parameter consists of two component parameters: (1) an 'Error Class' and (2) an 'Error Code'. See Clause 18. The 'Error Class' and 'Error Code' to be returned for specific situations are as follows:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Error Class</th>
<th>Error Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>There is not enough free memory for the element.</td>
<td>RESOURCES</td>
<td>NO_SPACE_TO_ADD_LIST_ELEMENT</td>
</tr>
<tr>
<td>The property or specified array element is not a list BACnetLIST.</td>
<td>SERVICES</td>
<td>PROPERTY_IS_NOT_A_LIST</td>
</tr>
<tr>
<td>An array index is provided but the property is not an array a BACnetARRAY of BACnetLIST.</td>
<td>PROPERTY</td>
<td>PROPERTY_IS_NOT_AN_ARRAY</td>
</tr>
<tr>
<td>An array index is provided that is outside the range existing in the property.</td>
<td>INVALID_ARRAY_INDEX</td>
<td></td>
</tr>
</tbody>
</table>

15.1.1.3.2 First Failed Element Number

This parameter, of type Unsigned, shall convey the numerical position, starting at 1, of the offending element in the 'List of Elements' parameter received in the request. If the request is considered invalid for reasons other than the 'List of Elements' parameter, the 'First Failed Element Number' parameter shall be equal to zero.
15.1.2 Service Procedure

After verifying the validity of the request, the responding BACnet-user shall attempt to modify the object identified in the 'Object Identifier' parameter. If the identified object exists and has the property specified in the 'Property Identifier' parameter, and if present has the array element specified in the 'Property Array Index' parameter, an attempt shall be made to add all of the elements specified in the 'List of Elements' parameter to the specified property or array element of the property. If this attempt is successful, a 'Result(+)' primitive shall be issued.

When comparing elements in the 'List of Elements' parameter with elements in the specified property or array element of the property, the complete element shall be compared unless the property description specifies otherwise. If one or more of the elements is already present in the list BACnetLIST, it shall be updated with the provided element, that is, the existing element is over-written with the provided element. Optionally, if the provided element is exactly the same as the existing element in every way, it can be ignored, that is, not added to the list BACnetLIST. Ignoring an element that already exists shall not cause the service to fail.

If the specified object does not exist, the specified property does not exist, or the specified array element does not exist, or the specified property or array element is not a list BACnetLIST, then the service shall fail and a 'Result(-)' response primitive shall be issued. If one or more elements cannot be added to, or updated in, the list BACnetLIST, a 'Result(-)' response primitive shall be issued and no elements shall be added to, or updated in, the list BACnetLIST.

The effect of this service shall be to add to, or update in, the list BACnetLIST all of the specified elements, or to neither add nor update any elements at all.
15.2 RemoveListElement Service

The RemoveListElement service is used by a client BACnet-user to remove one or more elements from the property of an object that is a list BACnetLIST or is a BACnetARRAY of BACnetLIST. If an element is itself a list, the entire element shall be removed. This service does not operate on nested lists.

15.2.1.1.1 Object Identifier

This parameter, of type BACnetObjectIdentifier, shall provide the means of identifying the object whose specified list property is to be modified by this service.

15.2.1.1.3 Property Array Index

If the property identified above is of datatype array BACnetARRAY of BACnetLIST, this conditional parameter of type Unsigned shall be present and shall indicate the array index of the array element of the referenced property to be modified by this service. Otherwise, it shall be omitted. The index value, if this parameter is present, shall not be zero.

15.2.1.4 List of Elements

This parameter specifies one or more elements that shall be removed from the property specified in the ‘Property Identifier’ parameter, or from the array element of the property if the ‘Property Array Index’ parameter is present. The datatype of the elements of this parameter is determined by the definition of the object type for the object specified by the ‘Object Identifier’ parameter.

15.2.1.3 Result(-)

The ’Result(-)’ parameter shall indicate that the service request failed. The reason for failure is specified by the ‘Error Type’ parameter. None of the elements of the specified object BACnetLIST shall be removed.

15.2.1.3.1 Error Type

This parameter consists of two component parameters: (1) an ‘Error Class’ and (2) an ‘Error Code’. See Clause 18. The ‘Error Class’ and ‘Error Code’ to be returned for specific situations are as follows:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Error Class</th>
<th>Error Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>A list element to be removed is not present</td>
<td>SERVICES</td>
<td>LIST_ELEMENT_NOT_FOUND</td>
</tr>
<tr>
<td>The property or specified array element is not a list BACnetLIST.</td>
<td>SERVICES</td>
<td>PROPERTY_IS_NOT_A_LIST</td>
</tr>
<tr>
<td>An array index is provided but the property is not an array BACnetARRAY</td>
<td>PROPERTY</td>
<td>PROPERTY_IS_NOT_AN_ARRAY</td>
</tr>
<tr>
<td>An array index is provided that is outside the range existing in the</td>
<td>PROPERTY</td>
<td>INVALID_ARRAY_INDEX</td>
</tr>
<tr>
<td>property.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
15.2.1.3.2 First Failed Element Number

This parameter, of type Unsigned, shall convey the numerical position, starting at 1, of the offending element in the 'List of Elements' parameter received in the request. If the request is considered invalid for reasons other than the 'List of Elements' parameter, the 'First Failed Element Number' parameter shall be equal to zero.

[Change Clause 15.2.2, p. 682]

15.2.2 Service Procedure

After verifying the validity of the request, the responding BACnet-user shall attempt to modify the object identified in the 'Object Identifier' parameter. If the identified object exists and it has the property specified in the 'Property Identifier' parameter, and if present has the array element specified in the 'Property Array Index' parameter, an attempt shall be made to remove the elements in the 'List of Elements' from the property or array element of the property of the object.

When comparing elements of the service with entries in the affected list BACnetLIST, the complete element shall be compared unless the property description specifies otherwise. If one or more of the elements does not exist or cannot be removed because of insufficient authority, none of the elements shall be removed and a 'Result(-)' response primitive shall be issued.
[Change Clause 15.8, p. 692]

15.8 ReadRange Service

The ReadRange service is used by a client BACnet-user to read a specific range of data items representing a subset of data available within a specified object property. The service may be used with any list BACnetLIST or array of lists BACnetARRAY of BACnetLIST property.

[Change Clause 15.8.1.1.3, p. 692]

15.8.1.1.3 Property Array Index

If the property identified above is of datatype array of lists BACnetARRAY of BACnetLIST, this optional parameter of type Unsigned shall indicate the array index of the element of the property referenced by this service. If the property identified above is not of datatype array of lists BACnetARRAY of BACnetLIST, this parameter shall be omitted. The index value, if this parameter is present, shall not be zero.

[Change Clause 15.8.1.1.4, p. 692]

15.8.1.1.4 Range

This optional parameter shall convey criteria for the consecutive range of items within the referenced property BACnetLIST that are to be returned, as described in Clause 15.8.2. The ‘Range’ parameter is shown in Table 15-14. The terminology and symbology used in this table are explained in Clause 5.6.

Table 15-14. Structure of the ‘Range’ Parameter

15.8.1.1.4.1 By Position

The ‘By Position’ parameter shall indicate that the particular items to be read are referenced by an index. For indexing of BACnetLIST items, see Clause 12.1.5.2.

15.8.1.1.4.1.1 Reference Index

The ‘Reference Index’ parameter specifies the index of the first (if ‘Count’ is positive) or last (if ‘Count’ is negative) item to be read.

15.8.1.1.4.1.2 Count

The absolute value of the ‘Count’ parameter specifies the number of records items to be read. If ‘Count’ is positive, the record item specified by ‘Reference Index’ shall be the first record item read and returned; if ‘Count’ is negative the record item specified by ‘Reference Index’ shall be the last record item. ‘Count’ may not be zero.

... 

15.8.1.1.4.2 By Sequence Number

The ‘By Sequence Number’ parameter shall indicate that the particular items to be read are referenced by a sequence number and that the response shall include the sequence number of the first returned item. This differs semantically from the ‘By Position’ parameter choice. The Reference Number Index provided in the ‘By Position’ choice references an item by its position in the list. In contrast, the Reference Sequence Number provided in the ‘By Sequence Number’ choice references an item by its sequence number, which it is given when the item is added to the list. Not all BACnetLIST lists properties or array elements that are a BACnetLIST implement the concept of a sequence number. An example of a list BACnetLIST that does implement the concept of a sequence number is the Log_Buffer property of the Trend Log object.

15.8.1.1.4.2.1 Reference Sequence Number
The 'Reference Sequence Number' parameter specifies the sequence number of the first (if 'Count' is positive) or last (if 'Count' is negative) item to be read.

### 15.8.1.1.4.2.1 Count

The absolute value of the 'Count' parameter specifies the number of records to be read. If 'Count' is positive, the record specified by 'Reference Sequence Number' shall be the first and oldest record read and returned. If 'Count' is negative the record specified by 'Reference Sequence Number' shall be the last and newest record read and returned. 'Count' shall not be zero.

... 

### 15.8.1.1.4.3 By Time

The 'By Time' parameter shall indicate that the particular item to be read is referenced by timestamp and that the Sequence Number of the item shall be returned in the response. This form of the service is expected to be used when searching lists that are loosely indexed by time.

#### 15.8.1.1.4.3.1 Reference Time

If 'Count' is positive, the first record to be read shall be the first record with a timestamp newer than the time specified by the 'Reference Time' parameter. If 'Count' is negative, the last record to be read shall be the newest record with a timestamp older than the time specified by the 'Reference Time' parameter. This parameter shall contain a specific datetime value.

#### 15.8.1.1.4.3.2 Count

The absolute value of the 'Count' parameter specifies the number of records to be read. If 'Count' is positive, the first record with a timestamp newer than the time specified by 'Reference Time' shall be the first and oldest record read and returned; if 'Count' is negative, the newest record with a timestamp older than the time specified by 'Reference Time' shall be the last and newest record. 'Count' shall not be zero.

... 

[Change Clause 15.8.1.2, p. 696]

### 15.8.1.2 Result(+)

The 'Result(+)' parameter shall indicate that the service request succeeded. A successful result includes the following parameters.

... 

#### 15.8.1.2.3 Property Array Index

If the property identified above is of datatype array of lists BACnetARRAY of BACnetLIST, this parameter of type Unsigned shall indicate the array index of the array element of the property referenced by this service. If the property identified above is not of datatype array of lists BACnetARRAY of BACnetLIST, this parameter shall be omitted.

#### 15.8.1.2.4 Result Flags

This parameter, of type BACnetResultFlags, shall convey several flags that describe characteristics of the response data:

\{FIRST_ITEM, LAST_ITEM, MORE_ITEMS\}

The FIRST_ITEM flag indicates whether this response includes the first list or array element item (in the case of positional indexing), or the oldest timestamped item (in the case of time indexing).
The LAST_ITEM flag indicates whether this response includes the last list or array element item (in the case of positional indexing), or the newest timestamped item (in the case of time indexing).

The MORE_ITEMS flag indicates whether more items matched the request but were not transmittable within the PDU.

15.8.1.2.5 Item Count
This parameter, of type Unsigned, represents the number of items that were returned.

15.8.1.2.6 Item Data
This parameter consists of a list of the requested data.

15.8.1.2.7 First Sequence Number
This parameter, of type Unsigned32, specifies the sequence number of the first item returned. This parameter is only included if the ‘Range’ parameter of the request was of the type ‘By Sequence Number’ or ‘By Time’ and ‘Item Count’ is greater than 0.

[Change Clause 15.8.1.3.1, p. 697]

15.8.1.3.1 Error Type
This parameter consists of two component parameters: (1) the ‘Error Class’ and (2) the ‘Error Code’. See Clause 18. The ‘Error Class’ and ‘Error Code’ to be returned for specific situations are as follows:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Error Class</th>
<th>Error Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specified property does not exist.</td>
<td>PROPERTY</td>
<td>UNKNOWN_PROPERTY</td>
</tr>
<tr>
<td>The specified property is currently not readable by the requestor.</td>
<td>PROPERTY</td>
<td>READ_ACCESS_DENIED</td>
</tr>
<tr>
<td>Property is not a list or array of lists BACnetLIST or BACnetARRAY</td>
<td>SERVICES</td>
<td>PROPERTY_IS_NOT_A_LIST</td>
</tr>
<tr>
<td>A n array index is provided but the property is not an array a BACnetARRAY</td>
<td>PROPERTY</td>
<td>PROPERTY_IS_NOT_AN_ARRAY</td>
</tr>
<tr>
<td>A n array index is provided that is outside the range existing in the property.</td>
<td>PROPERTY</td>
<td>INVALID_ARRAY_INDEX</td>
</tr>
<tr>
<td>The list items do not have a sequence number but a request 'By Sequence Number' was received.</td>
<td>PROPERTY</td>
<td>LIST_ITEM_NOT_NUMBERED</td>
</tr>
<tr>
<td>The list items are not timestamped but a request 'By Time' was received.</td>
<td>PROPERTY</td>
<td>LIST_ITEM_NOT_TIMESTAMPED</td>
</tr>
</tbody>
</table>

[Change Clause 15.8.2, p. 697]

15.8.2 Service Procedure
The responding BACnet-user shall first verify the validity of the ‘Object Identifier’, ‘Property Identifier’ and ‘Property Array Index’ parameters and return a ‘Result(-)’ response with the appropriate error class and code if the object or property is unknown, if the referenced property or array element is not a list or array BACnetLIST, the list items do not support the range selection type, or if it is currently inaccessible for another reason.

If the ‘Range’ parameter is not present, then the responding BACnet-user shall read and attempt to return all of the available items in the list or array BACnetLIST.

If the ‘Range’ parameter is present and specifies the ‘By Position’ parameters, then the responding BACnet-user shall read and attempt to return all of the items specified. The items specified include the item at the index specified by ‘Reference
Index' plus up to 'Count' - 1 items following if 'Count' is positive, or up to -1 - 'Count' items preceding if 'Count' is negative. The first element of a list shall be associated with index 1. For indexing of BACnetLIST items, see Clause 12.1.5.2.

If the 'Range' parameter is present and specifies the 'By Time' parameter, then the responding BACnet-user shall read and attempt to return all of the items specified. If 'By Time' parameters are specified and the property values items are not timestamped an error shall be returned. If 'Count' is positive, the records items specified include the first records items with a timestamp newer than 'Reference Time' plus up to 'Count'-1 items following. If 'Count' is negative, the records items specified include the newest record item with a timestamp older than 'Reference Time' and up to -1- 'Count' records items preceding. The sequence number of the first item returned shall be included in the response. The items shall be returned in chronological order.

If the 'Range' parameter is present and specifies the 'By Sequence Number' parameters, then the responding BACnet-user shall read and attempt to return all of the items specified. If 'By Sequence Number' parameters are specified and the items are not sequence numbered, an error shall be returned. The items specified are all items with a sequence number in the range 'Reference Sequence Number' to 'Reference Sequence Number' plus 'Count'-1 if 'Count' is positive, or in the range 'Reference Sequence Number' plus 'Count'+1 to 'Reference Sequence' if 'Count' is negative.

To avoid missing items when using chained time-based reads, the first item in the desired set should be found using the 'By Time' form of the 'Range' parameter. Subsequent requests to retrieve the remaining items in the desired set should use the 'By Sequence Number' form of the 'Range' parameter. The reason for this is that lists BACnetLIST items that include a timestamp but are ordered by time of arrival may have entries items with out-of-order timestamps due to negative time changes in the local device's clock. If items are read that match the request parameters but cannot be returned in the response, the 'Result Flags' parameter shall contain the MORE_ITEMS flag set to TRUE, otherwise it shall be FALSE. Remaining items may be obtained with subsequent requests specifying appropriately chosen parameters.

The returned response shall convey the number of items read and returned using the 'Item Count' parameter. The actual items shall be returned in the 'Item Data' parameter. If the returned response includes the first positional index and a 'By Position' request had been made, or the oldest sequence number and a 'By Sequence Number' or 'By Time' request had been made, then the 'Result Flags' parameter shall contain the FIRST_ITEM flag set to TRUE; otherwise it shall be FALSE.

If the returned response includes the last positional index and a 'By Position' request had been made, or the newest sequence number and a 'By Sequence Number' or 'By Time' request had been made, then the 'Result Flags' shall contain the LAST_ITEM flag set to TRUE; otherwise it shall be FALSE.

If there are no items in the list that match the 'Range' parameter criteria, then a Result(+) shall be returned with an 'Item Count' of 0 and no 'First Sequence Number' parameter.

[Add to Clause 18.3, p. 736]

18.3 Error Class - PROPERTY

This Error Class pertains to problems related to identifying, accessing, and manipulating the properties of BACnet objects, whether BACnet-defined or not. Since these errors generally apply to individual property characteristics, they do not necessarily signal that an entire service request has failed.

...-

LIST_ITEM_NOT_NUMBERED - List items were selected by sequence number, but the list items do not support a sequence number.

LIST_ITEM_NOT_TIMESTAMPED - List items were selected by time, but the list items do not support a timestamp.

[Move content of Clause 20.2.20 to new Clause 20.2.1.X, p. 770]
20.2.20 20.2.1.X Summary of the Tagging Rules

...

[Add new Clause 20.2.X, p.781]

20.2.X Encoding of a BACnetARRAY of BACnetLIST datatype

A BACnetARRAY of BACnetLIST property as a whole is encoded to allow recognition of array elements. Since each list element is of the same datatype, regular Sequence-Of encoding of both the array elements and the contents of the array elements would result in a sequence of values where the array elements cannot be distinguished. Therefore, a BACnetARRAY of BACnetLIST property shall be encoded, when accessed as a whole, as if it had been defined in ASN.1 as follows:

Property-Value ::= SEQUENCE OF SEQUENCE {
array-element  [0] SEQUENCE OF <datatype>
}

In this ASN.1 production, the <datatype> is a placeholder for the datatype defined for the single list elements in the array elements of the BACnetARRAY of BACnetLIST property.

The context tag [0] shall always be encoded as an open/close context tag, creating a frame for list elements and delimiting array elements.

Example: BACnetARRAY of BACnetLIST of primitive data list elements

Property = BACnetARRAY of BACnetLIST of Unsigned
Implied ASN.1: Property-Value ::= SEQUENCE OF SEQUENCE {
array-element  [0] SEQUENCE OF Unsigned
}

Value =     ((1,2,3),(),(4,5,6))

Encoded Tag = X'0E' (Opening Tag)
Application Tag = Unsigned Integer (Tag Number = 2)
Encoded Tag = X'21'
Encoded Data = X'01'
Application Tag = Unsigned Integer (Tag Number = 2)
Encoded Tag = X'21'
Encoded Data = X'02'
Application Tag = Unsigned Integer (Tag Number = 2)
Encoded Tag = X'21'
Encoded Data = X'03'
Enclosed Value = X'0F' (Closing Tag)

   -- in Clause 23.
}
135-2016bu-2 Clarifications on character and value encoding issues

Rationale

The BACnet standard indicates that received events cannot be rejected or otherwise failed by the receiver due to the character set chosen, but does not include a similar restriction for character encoding issues.

In addition, there is no error or reject enumeration defined for invalid value encoding.

The proposed changes add restrictions on event processing to disallow failing due to character encoding errors, requires consistent handling of character encoding corrections, and adds error and reject enumerations for bad value encoding.

[Add to Clause 3.2 Terms Defined for this Standard, p. 2, maintaining alphabetical order]

invalid character: Character-level encoding within a BACnet character string that is not defined by the governing body of the character encoding, or that breaks the rules of the governing body, or is not allowed by the rules of BACnet such as a null character when printable characters are required.

[Change Clause 12.1.4 Asymmetry in Property Values, p. 154]

In some devices, property values may be stored internally in a different form than indicated by the property datatype. For example, real numbers may be stored internally as integers, or with a more limited precision. This may result in the situation where a property value is changed by one of the WriteProperty services but a subsequent read returns a slightly different value. This behavior is acceptable as long as a “best effort” is made to store the written value specified.

Character strings may also be stored or processed internally using a different character set than indicated by the service request or may be modified when stored or processed in order to eliminate invalid characters. Any changes made to a character string as part of a write operation shall also be made to any character string received in another service request that is to be used for comparison or matching to a changed written character string.

For example, if a value written to an Object_Name property can be stored in a changed form, then a Who-Has service with an Object_Name parameter shall undergo the same changes such that a Who-Has containing the character string that was written to the Object_Name property will match the Object_Name value as it was stored in the object. Other examples of related character string values that are subject to the above requirement are the Present_Value, Alarm_Values, and Fault_Values properties of a CharacterString Value object.

[Insert new Clause 12.1.X before Clause 12.1.8, p. 157]

12.1.X Handling of invalid data encoding or excessive data length

Some BACnet data values are encoded using standards such as ISO 10646 (UTF-8) or ANSI/IEEE-754 (floating point) that do not allow for all possible combinations of bit values. In addition, limitations may exist for the display or use of some BACnet data values in a particular implementation. If a service or result contains data that is properly tagged, but has either invalid value encoding or is too long, the receiver of the data shall handle the data in a way that is consistent with the service procedure described for the service.

Some services such as AcknowledgeAlarm, ConfirmedEventNotification or UnconfirmedEventNotification shall be processed using recovery mechanisms that are a local matter. Other confirmed services such as WriteProperty may respond with a Result(-) if recovery mechanisms are not used. If a confirmed service Error Type clause lists the error INVALID_DATA_ENCODING, then it is permitted to respond with a Result(-) if invalid data encoding is detected.

Detection of invalid data value encoding and data value recovery mechanisms are not required, but are permitted.
13.5.2 Service Procedure

After verifying the validity of the request, the responding BACnet-user shall attempt to locate the specified object. If the object exists and if the 'Time Stamp' parameter matches the most recent time for the event being acknowledged, then the bit in the Acked_Transitions property of the object that corresponds to the value of the 'Event State Acknowledged' parameter shall be set to 1, a 'Result(+)’ primitive shall be issued, and an event notification with a ‘Notify Type’ parameter equal to ACK_NOTIFICATION shall be issued. Otherwise, a ‘Result(-)’ primitive shall be issued. An acknowledgment notification shall use the same type of service (confirmed or unconfirmed) directed to the same recipients to which a confirmed or unconfirmed event notification for the same transition type would be sent. The Time Stamp conveyed in the acknowledgment notification shall not be derived from the Time Stamp of the original event notification, but rather the time at which the acknowledgment notification is generated.

A device shall neither fail to process, nor issue a Result(-), due to an AcknowledgeAlarm service request containing an 'Acknowledgment Source' parameter in an unsupported character set or having invalid characters. In this case, it is a local matter whether the 'Acknowledgment Source' parameter is modified, used as provided, or whether a character string in a supported character set of length 0 is used in its place.

13.6.1.3.1 Error Type

This parameter shall consist of two component parameters: (1) the 'Error Class' and (2) the 'Error Code'. See Clause 18.

The 'Error Class' and 'Error Code' to be returned for specific situations are as follows:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Error Class</th>
<th>Error Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>No subscription exists for the specified object, property, and process</td>
<td>SERVICES</td>
<td>UNKNOWN_SUBSCRIPTION</td>
</tr>
<tr>
<td>identifier. Devices may ignore this condition and return a BACnet-SimpleACK-PDU.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>The encoding of a value specified in a service parameter is not valid for</td>
<td>SERVICES</td>
<td>INVALID_DATA_ENCODING</td>
</tr>
<tr>
<td>the datatype of the parameter.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

13.8.2 Service Procedure

After verifying the validity of the request, the responding BACnet-user shall take whatever local actions have been assigned to the indicated event occurrence and issue a 'Result(+)' service primitive. If the service request cannot be executed, a 'Result(-)' service primitive shall be issued indicating the encountered error. A device shall neither fail to process, nor issue a Result(-), due to a ConfirmedEventNotification service request containing a 'Message Text' parameter in an unsupported character set or having invalid characters. In this case, the consumption of the 'Message Text' parameter is a local matter.
13.9.2 Service Procedure

Since this is an unconfirmed service, no response primitives are expected. Actions taken in response to this notification are a local matter. A device shall not fail to process a request due to a 'Message Text' parameter in an unsupported character set or having invalid characters. In this case, the consumption of the 'Message Text' parameter is a local matter.

13.17.1.3.1 Error Type

This parameter shall consist of two component parameters: (1) the 'Error Class' and (2) the 'Error Code'. See Clause 18.

The 'Error Class' and 'Error Code' to be returned for specific situations are as follows:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Error Class</th>
<th>Error Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>No subscription exists for one of the specified objects, properties, and process identifier. Devices may ignore this condition and return a BACnet-SimpleACK-PDU.</td>
<td>SERVICES</td>
<td>UNKNOWN_SUBSCRIPTION</td>
</tr>
<tr>
<td>The encoding of a value specified in a service parameter is not valid for the datatype of the parameter.</td>
<td>SERVICES</td>
<td>INVALID_DATA_ENCODING</td>
</tr>
</tbody>
</table>

15.1.3.1 Error Type

This parameter consists of two component parameters: (1) an 'Error Class' and (2) an 'Error Code'. See Clause 18. The 'Error Class' and 'Error Code' to be returned for specific situations are as follows:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Error Class</th>
<th>Error Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>The data being written has a datatype not supported by the property.</td>
<td>PROPERTY</td>
<td>DATATYPE_NOT_SUPPORTED</td>
</tr>
<tr>
<td>The encoding is not valid for the datatype of the property.</td>
<td>PROPERTY</td>
<td>INVALID_DATA_ENCODING</td>
</tr>
</tbody>
</table>

15.3.1.3.1 Error Type

This parameter consists of two component parameters: (1) an 'Error Class' and (2) an 'Error Code'. See Clause 18. The 'Error Class' and 'Error Code' to be returned for specific situations are as follows:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Error Class</th>
<th>Error Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>The encoding is not valid for the datatype of the property.</td>
<td>PROPERTY</td>
<td>INVALID_DATA_ENCODING</td>
</tr>
</tbody>
</table>
15.9.1.3.1 Error Type

This parameter consists of two component parameters: (1) an 'Error Class' and (2) an 'Error Code'. See Clause 18. The 'Error Class' and 'Error Code' to be returned for specific situations are as follows:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Error Class</th>
<th>Error Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>The encoding is not valid for the datatype of the property.</td>
<td>PROPERTY</td>
<td>INVALID_DATA_ENCODING</td>
</tr>
<tr>
<td>The Priority parameter is not within the defined range of 1..16. This condition may be ignored if the property is not commandable.</td>
<td>SERVICES</td>
<td>PARAMETER_OUT_OF_RANGE</td>
</tr>
</tbody>
</table>

15.10.1.3.1 Error Type

This parameter consists of two component parameters: (1) an 'Error Class' and (2) an 'Error Code'. See Clause 18. The 'Error Class' and 'Error Code' to be returned in a 'Result(-)' for specific situations are as follows:

<table>
<thead>
<tr>
<th>Situation</th>
<th>Error Class</th>
<th>Error Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>The encoding is not valid for the datatype of the property.</td>
<td>PROPERTY</td>
<td>INVALID_DATA_ENCODING</td>
</tr>
<tr>
<td>The Priority parameter is not within the defined range of 1..16. This condition may be ignored if the property is not commandable.</td>
<td>SERVICES</td>
<td>PARAMETER_OUT_OF_RANGE</td>
</tr>
<tr>
<td>A syntax error is encountered in the message after one or more properties have been successfully written.</td>
<td>SERVICES</td>
<td>INVALID_TAG</td>
</tr>
</tbody>
</table>

[Add to Clause 18.3 Error Class - PROPERTY, pp. 736-737, maintaining alphabetical order]

INVALID_DATA_ENCODING - The encoding of a property value specified in a service parameter is not valid for the datatype of the property.

[Add to Clause 18.6 Error Class - SERVICES, pp. 739-740, maintaining alphabetical order]

INVALID_DATA_ENCODING - The encoding of a value specified in a service parameter is not valid for the datatype of the parameter.

[Add to Clause 18.9 Reject Reason, p. 743, maintaining alphabetical order]

INVALID_DATA_ENCODING - Generated in response to a confirmed request APDU that conveys a parameter whose encoding is not valid for the datatype of the parameter.

135-2016bu-3 Clarify transmission of unconfirmed COV notifications

Rationale

The standard is not clear about unconfirmed COV notification requests with respect to the relationship between subscriber-process-id parameter of zero and the use of unicast vs. broadcast addressing.

The proposed changes add clarifying language that makes these distinctions and restrictions.

[Add new Clause 13.1.2, p. 590]

13.1.2 Transmitting Unconfirmed COV Notification Requests

There are three circumstances under which a device may transmit an UnconfirmedCOVNotification request:

1) The device has an active COV or COV-multiple subscription that specifies 'Issue-Confirmed-Notifications' is FALSE, and a change of value occurs to the subscribed-to object or property or a notification delay elapses;
2) The device is configured, as a local matter, to send unsubscribed UnconfirmedCOVNotification or UnconfirmedCOVNotificationMultiple requests;
3) The device performs the device restart procedure as defined in Clause 19.3.

In the first case, since the subscriber device is known, the UnconfirmedCOVNotification or UnconfirmedCOVNotificationMultiple request shall be transmitted as a unicast to the subscriber device.

In the second case, the server may elect to deliver the unsubscribed UnconfirmedCOVNotification request using a unicast or broadcast address as configured. The 'Process Identifier' parameter for requests being broadcast shall be zero.

[Add to Clause 13.7, UnconfirmedCOVNotification Service, p. 642]
[Add to Clause 13.14, SubscribeCOV Service, p. 657]
[Add to Clause 13.15, SubscribeCOV Property Service, p. 659]
[Add to Clause 13.16, SubscribeCOV PropertyMultiple Service, p. 662]
[Add to Clause 13.18, UnconfirmedCOVNotificationMultiple Service, p. 670]

... When issuing COV notifications as a result of a subscription or resubscription, the notification shall always be unicast to the subscriber (See Clause 13.1.2).
135-2016bu-4 Clarify logging of event notifications

Rationale

A BACnet Event Log is perfectly suited to be used for storing information generated locally, including event notifications never transmitted as an APDU.

The amended language of the second paragraph of the Event Log preamble Clause 12.27 adds a sentence to explicitly support this.

[Change Clause 3.2, event-initiating object entry, p. 2]

**event-initiating object**: an object that is configured to monitor its event state and can report changes in its state.

[Change Clause 12.27 as follows]

12.27 Event Log Object Type

An Event Log object records event notifications with timestamps and other pertinent data in an internal buffer for subsequent retrieval. Each timestamped buffer entry is called an event log "record."

Each Event Log object maintains an internal, optionally fixed-size buffer. This buffer fills or grows as event log records are added. If the buffer becomes full, the least recent records are overwritten when new records are added, or collection may be set to stop. Event log records are transferred as BACnetEventLogRecords using the ReadRange service. The buffer may be cleared by writing a zero to the Record_Count property. The determination of which event notifications are placed into the log is a local matter, including those never transmitted as an APDU. Each record in the buffer has an implied SequenceNumber that is equal to the value of the Total_Record_Count property immediately after the record is added.

...
135-2016bu-5 Clarify recording of status events in log buffers

Rationale

The current language is not clear on recording of status events in log buffers when logging is enabled or disabled.

The proposed changes on the Enable property clarify this language to cover all situations.

[Change Clause 12.25.5, p. 301]

12.25.5 Enable

This property, of type BOOLEAN, indicates and controls whether (TRUE) or not (FALSE) logging of events and collected data is enabled. Logging occurs if and only if Enable is TRUE, Local_Time is on or after Start_Time, and Local_Time is before Stop_Time. If Start_Time contains an unspecified datetime, then it shall be considered equal to ‘the start of time’. If Stop_Time contains an unspecified datetime, then it shall be considered equal to ‘the end of time’. As an exception, log records of type logstatus in which the BUFFER_PURGED flag is set to TRUE shall always be recorded without regard to the value of the Enable property.

...
135-2016bu-6. Clarify the Event Enrollment object reliability evaluation.

Rationale

In Clause 12.12.21, the wording is unclear as to the value of the Reliability property of an Event Enrollment object when the monitored object is in FAULT event state.

The proposed changes clarify this language.

[Change Clause 12.12, p. 222]

12.12 Event Enrollment Object Type

For the reliability indication by the Reliability property of the Event Enrollment object, internal unreliable operation such as configuration error or communication failure takes precedence over reliability indication for the monitored object (i.e., MONITORED_OBJECT_FAULT). Fault indications determined by the fault algorithm, if any, have least precedence.

[Change Clause 12.12.21, p. 227]

12.12.21 Reliability

This property, of type BACnetReliability, provides an indication of:

- the ability of the Event Enrollment object to perform its monitoring function,
- in addition to the reliability of the monitored object, and
- the result of the fault algorithm, if one is in use.

When determining the reliability of an Event Enrollment object, first the reliability of the Event Enrollment object itself shall be checked, followed by the reliability of the monitored object, and finally the reliability conditions are checked by the fault algorithm, if one is in use. If one of these evaluations encounters a value other than NO_FAULT_DETECTED, the sequence of evaluations shall be stopped and that reliability value shall be stored in the Reliability property.

The reliability-evaluation in an Event Enrollment object is processed in the following order:

1) Evaluate the reliability of the Event Enrollment object itself.
2) If the reliability is NO_FAULT_DETECTED, then if the reliability of the monitored object is not NO_FAULT_DETECTED, then the reliability shall be MONITORED_OBJECT_FAULT.
3) If the reliability is NO_FAULT_DETECTED, then evaluate the fault algorithm, if one is in use, to determine the reliability.

If a fault algorithm is applied, then this property shall be the pCurrentReliability parameter for the object's fault algorithm. See Clause 13.4 for fault algorithm parameter descriptions.

Rationale

Clause 12.1.8 clearly states that internally generated faults take precedence over fault algorithms, while Clause 12.50.11 for the Global Group object's Reliability property states it is a local matter what fault type takes precedence.

The proposed changes remove duplicate and contradictory language in Clause 12.50.11.

[Change Clause 12.1.8, p. 156]

12.1.8 Reliability

Several object types defined in this clause have a property called "Reliability" that indicates the existence of fault conditions for the object. Reliability-evaluation is the process of determining the value for this property. The first stage of reliability-evaluation is internal to the object and is completely defined by the device's vendor. The second stage, which is only found in certain object types, is the application of a fault algorithm. Faults detected in the first stage shall take precedence over faults detected in the second stage. See Clause 13.4 for fault algorithm definitions and see the object type definitions to determine the fault algorithm supported by any particular object type. The different values that the Reliability property can take on are described below. Note that not all values are applicable to all object types.

[Change Clause 12.50.11, p. 470]

12.50.11 Reliability

This property, of type BACnetReliability, provides an indication of whether the Present_Value is "reliable" as far as the BACnet device or operator can determine. If the FAULT flag of the Member_Status_Flags has a value of TRUE, then the value of this property shall be MEMBER_FAULT. If one or more group member values cannot be updated because of a communication failure, the value of this property shall be COMMUNICATION_FAILURE. If the conditions for a MEMBER_FAULT and a COMMUNICATION_FAILURE are both present, the selection of which value to use is a local matter.

If a fault algorithm is applied, then this property shall be the pCurrentReliability parameter for the object's fault algorithm. See Clause 13.4 for fault algorithm parameter descriptions.

1. Introduce BACnet ARRAY of BACnetLIST collection property data type.
2. Clarifications on character and value encoding issues.
3. Clarify transmission of unconfirmed COV notifications.
4. Clarify logging of event notifications.
5. Clarify recording of status events in log buffers.
6. Clarify the Event Enrollment object reliability evaluation.
7. Clarify the Global Group object reliability evaluation.
ASHRAE is concerned with the impact of its members’ activities on both the indoor and outdoor environment. ASHRAE’s members will strive to minimize any possible deleterious effect on the indoor and outdoor environment of the systems and components in their responsibility while maximizing the beneficial effects these systems provide, consistent with accepted Standards and the practical state of the art.

ASHRAE’s short-range goal is to ensure that the systems and components within its scope do not impact the indoor and outdoor environment to a greater extent than specified by the Standards and Guidelines as established by itself and other responsible bodies.

As an ongoing goal, ASHRAE will, through its Standards Committee and extensive Technical Committee structure, continue to generate up-to-date Standards and Guidelines where appropriate and adopt, recommend, and promote those new and revised Standards developed by other responsible organizations.

Through its Handbook, appropriate chapters will contain up-to-date Standards and design considerations as the material is systematically revised.

ASHRAE will take the lead with respect to dissemination of environmental information of its primary interest and will seek out and disseminate information from other responsible organizations that is pertinent, as guides to updating Standards and Guidelines.

The effects of the design and selection of equipment and systems will be considered within the scope of the system’s intended use and expected misuse. The disposal of hazardous materials, if any, will also be considered.

ASHRAE’s primary concern for environmental impact will be at the site where equipment within ASHRAE’s scope operates. However, energy source selection and the possible environmental impact due to the energy source and energy transportation will be considered where possible. Recommendations concerning energy source selection should be made by its members.
About ASHRAE

Founded in 1894, ASHRAE is a global professional society committed to serve humanity by advancing the arts and sciences of heating, ventilation, air conditioning, refrigeration, and their allied fields.

As an industry leader in research, standards writing, publishing, certification, and continuing education, ASHRAE and its members are dedicated to promoting a healthy and sustainable built environment for all, through strategic partnerships with organizations in the HVAC&R community and across related industries.

To stay current with this and other ASHRAE Standards and Guidelines, visit www.ashrae.org/standards, and connect on LinkedIn, Facebook, Twitter, and YouTube.

Visit the ASHRAE Bookstore

ASHRAE offers its Standards and Guidelines in print, as immediately downloadable PDFs, and via ASHRAE Digital Collections, which provides online access with automatic updates as well as historical versions of publications. Selected Standards and Guidelines are also offered in redline versions that indicate the changes made between the active Standard or Guideline and its previous version. For more information, visit the Standards and Guidelines section of the ASHRAE Bookstore at www.ashrae.org/bookstore.

IMPORTANT NOTICES ABOUT THIS STANDARD

To ensure that you have all of the approved addenda, errata, and interpretations for this Standard, visit www.ashrae.org/standards to download them free of charge.

Addenda, errata, and interpretations for ASHRAE Standards and Guidelines are no longer distributed with copies of the Standards and Guidelines. ASHRAE provides these addenda, errata, and interpretations only in electronic form to promote more sustainable use of resources.
